Globally, fisheries and aquaculture production is an important source of accessible nutritious food, and a basis of livelihoods. It is also a key driver of coastal and rural economic well-being. However, overfishing, illegal fishing and the combined effects of ocean-based activities and climate change on resources and ecosystems put the sector at risk and undermine the resilience of those relying on it in many places. Improving fisheries and aquaculture management is crucial to ensure future generations continue to benefit from Ocean resources and ecosystem services.

The country notes of the OECD Review of Fisheries 2020 present each country’s situation in brief and identify best policy practices and reform pathways. These notes can also inform dialogue on progress towards internationally-adopted goals and targets with respect to sustainable fisheries and aquaculture management and support policies.

Overview of the sector

Fisheries and aquaculture production

In 2018, Germany produced 0.3 million tonnes of fish (including molluscs and crustaceans), with a value of USD 467.1 million. 29% of this value came from aquaculture and 71% from fisheries (that is, the capture of wild resources). Between 2008 and 2018, the quantity produced decreased by 2%, while its value increased by 2%.

![Figure 1: Fisheries and aquaculture’s contribution to seafood production](image)

Note: Seafood production volume is expressed in live weight tonnes. The value of aquaculture production is estimated based on unit value by live weight tonne, while the value of marine fisheries refers to the value of landings.
Production and trade in the global context

Germany is a net importer of fish and fish products. Between 2008 and 2018, exports increased by a total of 6%, while imports increased by 22%.

Employment and fleet

In 2018 Employment in the seafood sector, including processing, accounted for 2424 jobs. This represented 31% less jobs than in 2008. Over the same period, the average value of production per employee increased by 55% in marine fisheries and increased by 22% in aquaculture.

In 2018, the fleet consisted of 1335 powered vessels, down by 27% since 2008. Small-scale vessels, those below 12 meters in length, accounted for 78.9% of the total number of vessel. The total gross tonnage of the German fleet in 2018 was 58804 tonnes, down by by 15% since 2008. Small-scale vessels accounted for 4.7% of the total gross tonnage.

Government support to fisheries

Governments provide support to their fisheries sectors through a wide range of policies. The objectives vary but tend to centre on goals such as maintaining employment, improving fishers’ welfare, or ensuring the sustainability of the sector and the resources it relies on. Usually, government finance services to the fisheries sector, which benefit the sector as a whole or some of its segments, and also provide direct support to individuals and companies.

Financing of services to the fisheries sector

In 2018, Germany spent EUR 14.7 million (USD 17.4 million) financing services to the fisheries sector while EUR 0 million (USD 0 million) was recouped via cost-recovery charges, that is, fees paid by service users, such as for port access or management, and taxes or fees on resource use and associated profits. Having the sector bear some of the cost of services, reduces the extent to which taxpayers finance it. Net of cost-recovery charges, the public cost of services to the fisheries sector amounted to 5.2% of the value of production, while the OECD average was 8.5% in 2018.

The intensity of fisheries services financing relative to fleet size was USD 295.7 per gross tonne (gt) of total fleet capacity in 2018. This compares with an OECD average of USD 601.8 per gt in 2018.

Some services to the sector aim to ensure its sustainability or improve fishing communities’ well-being, while only indirectly supporting the intensity of fishing activities. In the OECD, such services, including management, control and surveillance, accounted for an average of 59.2% of spending on services to the sector in 2018.

Other services target fishers’ ability to operate their businesses more efficiently or more sustainably, such as investment in education and training, marketing and promotion or research and development. These services accounted for an average of 16% of spending on services to the sector in the OECD in 2018.

Finally, some forms of support can have a more direct relationship with production capacity, such as investment in or subsidised access to infrastructure like ports. In the OECD, these services have accounted for an average of 24.5% of financing of services to the sector in 2018.

Figure 5: Financing of services to the fisheries sector, 2018

Note: Figure uses the latest data reported by Germany (2018) and OECD average for 2018.
Direct support to individuals and companies in the fisheries sector

In 2018, Germany provided support totalling EUR 5 million (USD 5.9 million) through policies directly benefiting individuals and companies in the fisheries sector, up by a total of 739% since 2014. This amounted to 1.8% of the value of production.

A common objective of direct support policies is to maintain or increase the incomes of fishers. Relative to employment, direct support to individuals and companies increased by 752% since 2014, reaching USD 2712.3 per fisher in 2018.

Direct support to individuals or companies originates in a variety of policies. Some payments can be partially decoupled from fishing activities, such as income support, special insurance systems. Germany spent USD 2176.5 per fisher on these types of policies in 2018. In the OECD, the average spending per fisher was USD 496.8 in 2018.

Benefits can also be given in exchange for capacity reduction, such as through decommissioning schemes or payments for early retirement.

Other policies are directed at lowering the cost of inputs. These include support for fuel, for other variable inputs (like payments to reduce the cost of ice or bait) and for fixed inputs (such as support to vessel construction and modernization or to the purchase of gear). In 2018, Germany spent USD 239.7 per fisher on policies lowering the cost of inputs.

The impact of support policies varies depending both on the type of policy and the effectiveness of fisheries management. For example, OECD work has shown that support to fuel is one of the least effective means of transferring income to fishers; while policies lowering the cost of inputs more generally are the most likely to provoke overcapacity, overfishing and illegal, unreported and unregulated (IUU) fishing. OECD analysis has also demonstrated that support policies generally benefit fishers more and are less likely to encourage unsustainable fishing when an effective management system is in place (e.g. when total allowable catch limits are used).

Figure 6: Intensity of direct support to individuals and companies relative to employment, 2018

Source: OECD datasets ‘Fisheries Support Estimate (FSE)’ and ‘Employment’ (OECD.Stat)
Notes: Figure uses the latest data reported by Germany (2018) and OECD average for 2018.
*In the OECD dataset ‘Fisheries Support Estimate (FSE)’ (OECD.Stat), there are two different types of support to fuel, tax concessions and direct transfers to reduce the cost of fuel. Since impacts are similar, they are jointly considered as support to fuel. Tax concession to fuel are often not specific to fisheries, as the same policies sometimes also apply to other sectors such as agriculture, a number of countries and economies reporting to the FSE database do not include it in their reporting, which affects the relative total support to inputs.
Sustainable fisheries management

With the adoption of Sustainable Development Goal 14 (SDG 14) of the 2030 Agenda for Sustainable Development, member countries of the United Nations (UN) agreed to end overfishing by 2020 and effectively regulate fishing activities on the basis of science.

Ending overfishing relies on controlling the quantity of fish being caught, and enforcing scientifically established total allowable catches (TACs) for at least the main species of commercial interest is recognised as an effective and transparent way of achieving this. The value of production of the top-5 German species was USD 201.7 million, accounting for 60.8% of total fisheries production value in 2018. 3 of these species were then entirely under TAC limits, while 0 were partly under TAC limits (i.e. TAC limits were set for some fisheries targeting these species but not all).

Regularly assessing the status of individual fish stocks is an essential component of sustainable fisheries management. Determining where stocks sit with respect to key limit or target reference points allows management performance to be evaluated. For the Review of Fisheries 2020, a total of 1119 stocks across 16 countries and economies (including the European Union), were reported as having recently been assessed, of which, 734 (66%) were assessed to have a biologically favourable status.

Determining stock status and enforcing TACs on the basis of quantitative assessments can require extensive information and expertise. In some cases, such as when fishers harvest a wide variety of species, the value of a stock is low, or data is unavailable, the cost and practicality of quantitatively assessing and managing individual stocks with TACs can be prohibitive. In these instances, data on catch rates and other relevant sources of information might be utilised to infer stock status. In addition, alternative tools to control the impact of fishing include limits to fishing effort such as on days at sea or fishing licenses and restrictions on fishing practices such as on fishing areas, gear and seasons. Such tools were used to manage 5 of the top-5 species.

Figure 7: Use of total allowable catch (TAC) limits in managing the key species

Note: Figure uses the latest data reported (2018).
Fighting illegal, unreported and unregulated (IUU) fishing

IUU fishing harms law-abiding fishers by creating unfair competition and cutting profitability and employment opportunities, while weakening food security in countries that depend on local seafood. IUU fishing also undermines governments’ capacity to manage fish stocks sustainably by adding pressure that is difficult to quantify when setting catch limits. It further threatens ecosystems when it makes use of damaging harvest methods and targets species that are already endangered.

Adopting and implementing internationally recognised best policies and practices against IUU fishing is thus key to accelerate the elimination of this serious threat as agreed under SDG 14, which sets the objectives to end IUU fishing and eliminate subsidies contributing to it by 2020.

The OECD IUU policy indicators investigate the extent to which countries meet their responsibilities in the most important dimensions of government intervention in relation to IUU fishing:

- **Vessel registration**, by which countries collect and publicize information on vessels operating in their exclusive economic zone (EEZ) or flying their flag;
- **Authorisation to operate in the EEZ**, by which countries regulate fishing and fishing-related operations in their EEZ;
- **Authorisation to operate outside the EEZ**, by which countries regulate the operations of vessels flying their flag in areas beyond national jurisdictions and in foreign EEZs;
- **Port measures**, by which countries monitor and control access to and activities at port;
- **Market measures**, by which countries regulate how products enter the market and flow through the supply chain and economically discourage IUU fishing;
- **International co-operation**, by which countries engage in regional and global information sharing and joint activities against IUU fishing.

Germany performs most strongly in Vessel registration; greatest scope for progress is in the area of Market measures.

News from Germany

- In small-scale fisheries reliable effort and catch data is largely missing for the smallest vessels in the fleet. To address this problem, a smartphone application for recording position data of these vessels has been developed and successfully implemented in 2018 (“Mofi”). In 2018, it was used to monitor the exemption from the closure period for western Baltic cod for small-scale fisheries in waters of less than 20m depth, providing an incentive for its use. However, there was no obligation in the following years to use “Mofi”.

- In 2018 and 2019 Germany introduced additional closure periods for cod and herring in the Western Baltic. This measure has been accompanied by financial support for the fishermen.

- All major fishing resources for the German coastal fishery in the Baltic have been cut significantly for 2020, because the target stocks are not in good shape - for very different reasons: impact of climate change (Western Baltic herring), eutrophication (Eastern Baltic cod, and overfishing (Western Baltic cod).

- The German baltic sea fishere is in a very difficult situation (even prior to the Corona crisis), due to the significant cuts in quotas. It can be expected that a significant fraction of the baltic fishing fleet will cease business within the next 2 years. This will have an impact also on the remaining businesses and the land structures they need for support. The 2020 quotas for the larger vessels fishing at high seas showed no clear trend. It remained stable for the most important herring stocks and increased for mackerel (+41%) while the blue whiting quota dropped again by about 20%. The demersal sector is mainly affected by severely reduced cod quotas in the North Sea (-50%) and in Greenland waters (-7%). The mid-size North Sea fleet was facing an increased haddock (+23%) and plaice (+17%) quota, while North Sea cod and saithe quota were decreased by -50% and -15%, respectively.

- The need to avoid catches of cod in the Baltic Sea demersal fisheries has increased the need to develop more selective trawls, such as the sorting of different species according to their body shape or behaviour during the catch process. The German Thünen Institute will present solutions ready to be implemented in the fishery in 2021.

- According to ICES Assesssments North Sea cod fell below Blim in 2019. The TAC was considerably reduced and further measures, such as seasonal and real time closures are to be expected to be implemented in 2021 to protect the spawning stock. A cod avoidans plan is already in force since August 2020. Consequently, negative impacts for the North sea groundfish fisheries are to be expected, which will likely be exacerbated by the COVID-19 pandemic.

The OECD Review of Fisheries 2020 aims to support policy makers and sector stakeholders in their efforts to deliver sustainable and resilient fisheries that can provide jobs, food and livelihoods for future generations. The Review updates and analyses the OECD fisheries support estimate (FSE) database, the most comprehensive, detailed, and consistent collection of country level data on governments support to fisheries. It also presents and analyses newly-assembled data on the health of fish stocks; on the management of key stocks of commercial interest; and on the governance of fisheries across OECD countries and emerging economies with large fishing sectors. The report sheds light on how governments are managing fisheries to minimise detrimental impacts on resources and ecosystems, eliminate illegal, unregulated and unreported (IUU) fishing, while increasing the socio-economic benefits from fishing. It suggests priorities for action both at the national level and for the international community.
