About the AI Wonk

The AI Wonk is a space where the [OECD Network of Experts on AI \(ONE AI\)](#) and guest contributors share their experiences and research. It is an ongoing conversation about [the OECD AI Principles](#) and how to best share and shape trustworthy AI policies that benefit individuals, communities and economies.

An open call for input from GPAI's Data

Transparency and explainability (Principle 1.3)

This principle is about transparency and responsible disclosure around AI systems to ensure that people understand when they are engaging with them and can challenge outcomes.

Rationale for this principle

The term transparency carries multiple meanings. In the context of this Principle, the focus is first on disclosing when AI is being used (in a prediction, recommendation or decision, or that the user is interacting directly with an AI-powered agent, such as a chatbot). Disclosure should be made with proportion to the importance of the interaction. The growing ubiquity of AI applications may influence the desirability, effectiveness or feasibility of disclosure in some cases.

Transparency further means enabling people to understand how an AI system is developed, trained, operates, and deployed in the relevant application domain, so that consumers, for example, can make more informed choices. Transparency also refers to the ability to provide meaningful information and clarity about what information is provided and why. Thus transparency does not in general extend to the disclosure of the source or other proprietary code or sharing of proprietary datasets, all of which may be too technically complex to be feasible or useful to understanding an outcome. Source code and datasets may also be subject to intellectual property, including trade secrets.

An additional aspect of transparency concerns facilitating public, multi-stakeholder discourse and the establishment of dedicated entities, as necessary, to foster general awareness and understanding of AI systems and increase acceptance and trust.

Explainability means enabling people affected by the outcome of an AI system to understand how it was arrived at. This entails providing easy-to-understand information to people affected by an AI system's outcome that can enable those adversely affected to challenge the outcome, notably – to the extent practicable – the factors and logic that led to an outcome. Notwithstanding, explainability can be achieved in different ways depending on the context (such as, the significance of the outcomes). For example, for some types of AI systems, requiring explainability may negatively affect the accuracy and performance of the system (as it may require reducing the solution variables to a set small enough that humans can understand, which could be suboptimal in complex, high-dimensional problems), or privacy and security. It may also increase complexity and costs, potentially putting AI actors that are SMEs at a disproportionate disadvantage.

Therefore, when AI actors provide an explanation of an outcome, they may consider providing – in clear and simple terms, and as appropriate to the context – the main factors in a decision, the determinant factors, the data, logic or algorithm behind the specific outcome, or explaining why similar-looking circumstances generated a different outcome. This should be done in a way that allows individuals to understand and challenge the outcome while respecting personal data protection obligations, if relevant.

BACK-UP

Objective:

- provide a structure to assess and classify AI systems according to their impact on public policy in areas covered by the OECD AI Principles.

Key points:

- The framework is simplified and user-friendly rather than exhaustive.
- The robustness and applicability of the present framework will be tested in late 2020 / early 2021 and adjustments made if needed.
- The 10 OECD AI Principles are used to structure the analysis of policy considerations associated with each dimension and sub-dimension

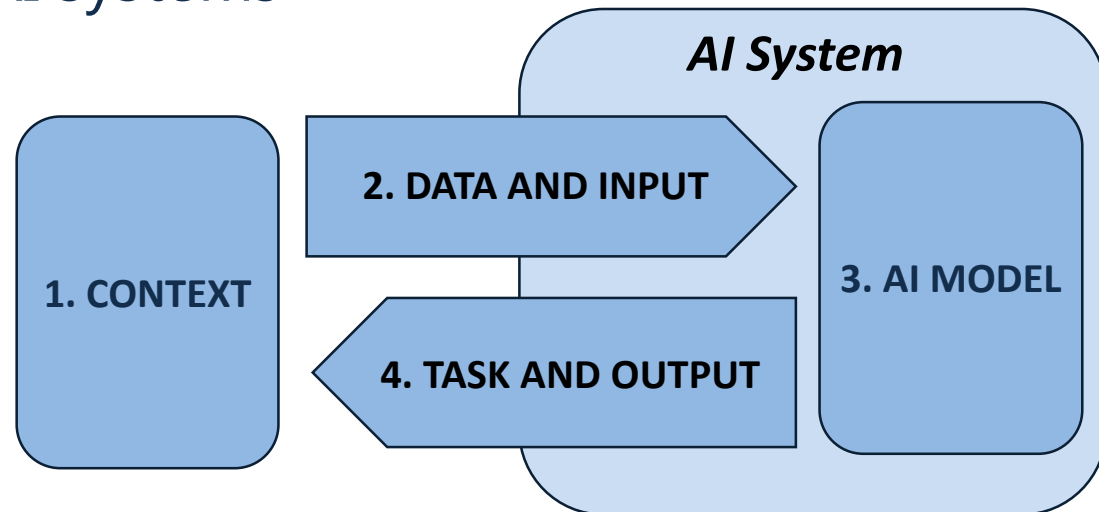

Values-based principles for all AI actors

- 1.1. Economic, social and environmental impact
- 1.2. Human rights including privacy, fairness
- 1.3. Transparency, explainability
- 1.4. Robustness, security, safety
- 1.5. Accountability

Recommendations to policy makers

- 2.1. Investment in research
- 2.2. Data, compute, technologies
- 2.3. Enabling policy and regulatory environment
- 2.4. Jobs, automation, skills
- 2.5. International cooperation

A user-friendly framework to navigate policy implications of different *types* of AI systems

4 key dimensions:

1. **Context**, including sector (healthcare, etc.), impact and scale
2. **Data and input**, including data collection, personal nature of data
3. **AI model (technologies)**, incl. model type and model building process
4. **Task and output**, incl. AI system's task (e.g., recognition, personalisation, etc.) and action autonomy

Type of approach	Type of tool
<p>Process-related approaches</p>	Guidelines
	Governance frameworks
	Product development / lifecycle tools
	Risk management
	Sector-specific codes of conduct
	Process standards
<p>Technical approaches</p>	Technical validation approaches
	Technical documentation
	Technical standards
	Toolkits / toolboxes / software tools
<p>Capacity / awareness building approaches</p>	Educational material
	Change management processes

Tool properties [*what the tool is*]

- Type of approach
- Type of tool
- Tool maturity
- Tool design
- Tool usage
- Tool application

Tool functionality [*what the tool does*]

- Relevant to which AI Principle
- Relevant to which AI lifecycle stage
- Helps to assess impact
- Helps to evaluate implementation
- Includes accountability mechanisms
- Encourages consultations with stakeholders
- Includes sharing mechanisms

Implementation incentives [*why use the tool*]

- Incentives to use
- Enforcement mechanisms

Tool properties [what the tool is]	Type of approach	e.g. see Table A A.1	
	Type of tool	e.g. see Table A A.1	
	Tool maturity	e.g. project stage; in development; running code	
	Tool design	Tool developer	e.g. academia; business; civil society; government; intergovernmental; multi-stakeholder; NGO; technical community; trade union
		Tool maintenance	e.g. tool is maintained / sustainable
	Tool usage	Target audience of the tool	e.g. designers; developers; workers; etc.
		Resource requirements	e.g. infrastructure; data; skill; budget requirements...feasibility for SMEs, developing countries, ease of implementation, etc.
		Openness of the tool	e.g. closed; open; other
	Tool application	Sector specificity	e.g. sector specific; horizontal (applicable to several sectors)
		Neutrality	e.g. technology / platform neutral
AI specificity		e.g. AI-specific; broader digital issue	
Scalability		e.g. scalable / can be mainstreamed	
Scope		e.g. general; practical	
Tool functionality [what the tool does]	Relevant to which AI Principle(s)	e.g. Principles 1.1-2.5	
	Relevant to which AI system lifecycle stage	e.g. planning & design; data collection & processing; model building & interpretation; verification & validation; deployment; operation & monitoring	
	Helps to assess impact of implementing Principles	e.g. impact; trade-off; cost-benefit analysis	
	Helps to evaluate implementation of Principles	e.g. testing; evaluation; monitoring	
	Includes accountability mechanisms	e.g. ombudsman; ethical board; compliance; redress mechanisms; clear roles & responsibilities -- responsible actor for system malfunction	
	Encourages consultations with affected parties	e.g. on the design and/or implementation of AI systems	
	Includes sharing mechanisms / platforms	e.g. to share good practices, lessons learned, code improvements, etc.	
Implementation incentives [why use the tool]	Incentives to use	e.g. financial; social / reputational; ethical; job quality; regulatory incentives; difficulty of free-riding	
	Enforcement mechanisms	e.g. certification; regulation; oversight body	

1. Policy design – governance, processes to formulate national AI policies

National AI governance
Horizontal coordination
Consultations

2. Policy implementation

Investing in AI R&D;
Data, compute, software & knowledge;
Regulation, testbeds, documentation;
Automation, skills;
Tools for trustworthy AI:
- *Codes of conduct, guidelines*
- *Standards, software tools, research*
- *Capacity building*

3. Policy Intelligence

Translating AI policies into action plans & targets.
Evaluating implementation of AI policies
Benchmarks and indicators

4. International multi-stakeholder co-operation

IGOs e.g. OECD, EC, IDB, CoE, UNESCO, UN, World Bank.
Cooperation on standards e.g. ISO
Multi-stakeholder initiatives

Introducing the ONE AI Compute Task Force

- National policy imperative to invest in AI
- AI is not IT - requires specialized compute stack (HW+SW)
- AI compute has so far received less attention
- Growing AI compute divide = economic inequity
- Impact beyond academia – industry, jobs, public health, etc.
- Policy makers need non-technical framework to understand:
 - What do we have?
 - How does it compare?
 - Is it enough?

AI enablers
